Addendum Data Methodology

The demographic data used in STDB Online are developed by Experian/Applied Geographic Solutions (AGS) using a variety of source data sets, including, but not limited to information from Experian's INSOURCE™ household level data file, the Census Bureau's American Community Survey (ACS) results, current year estimates from the Census Bureau, Postal Service delivery counts, and economic forecasts from private sources. In addition:

- * A unique bottom-up approach using household data is complemented by a rigorous, standard demographic cohort-component technique at the county level and above. AGS control totals are based on Census Bureau estimates advanced methodically to the current year and projected out five years. AGS takes the position that 10-year projections (other than total population and households) introduce unacceptable levels of uncertainty.
- * Migration effects, the most difficult to quantify for small area estimates, are taken into account through the Census Bureau's extensive analysis of IRS tax return data (maintaining strict confidentiality of individual records). From this, detailed county-to-county migration trends are established. AGS also takes into account undocumented immigration.
- * AGS methods make use of the current census MARS (modified age, race, sex) tabulation that corrects the current census for errors in age reporting (for example, grouping around age 21 and 65) and reallocates Hispanics from the "other race" category to more specific race groups. Any current analysis of opportunities in emerging ethnic markets should take this into account.
- * Also included are Medicare eligible population counts at the ZIP code level, including population by sex and 5-year age cohorts, provided by the Health Care Financing Administration of Social Security. These counts provide a very accurate local count of the population aged 65 and higher.
- * With a foundation of the Experian household level databases and over fifteen years of experience in demographic forecasting, AGS offers the highest quality demographic estimates in the marketplace today.
- * AGS made extensive efforts to incorporate the Census Bureau's American Community Survey (ACS) results in the 2005 estimates. The ACS is an annual survey which over the course of several years will result in a national rolling estimates database which is eventually intended to replace the decennial SF3 sample database. The ACS results at the county scale are an excellent means of tracking demographic attributes over the course of the decade. ACS results were used at the state level and for two hundred and forty-one counties accounting for just over 60% of the nation's population.
